

Advances in Bird Migration Research and Conservation in the Central Asian Flyway

Presented by

Dr Taej Mundkur

Senior Advisor, Wetlands International

Good Earth Environmental, The Netherlands

Taej.mundkur@gmail.com

CENTRAL ASIAN FLYWAY

Major waterbird flyways

"A flyway is the entire range of a migratory bird species (or groups of related species or distinct populations of a single species) through which it moves on an annual basis from the breeding grounds to non-breeding areas, including intermediate resting and feeding places as well as the area within which the birds migrate."

(Boere, G.C. & Stroud, D.A. 2006. *The flyway concept: what it is and what it isn't*. *Waterbirds around the world*. Eds. G.C. Boere, C.A. Galbraith & D.A. Stroud. The Stationery Office, Edinburgh, UK. pp. 40-47. Available on: <http://jncc.defra.gov.uk/worldwaterbirds>)

Osprey migration

[Reprint From Journal Bombay Nat. Hist. Society, Vol. 85(1) 190 April 1988]

11. RECOVERY OF A NORWEGIAN RINGED OSPREY IN GUJARAT, INDIA

On November 5, 1985, Mr. A. N. Jadeja saw a large bird falling into his field after having collided with a high tension electric line near Kajurda village (22°20' N, 69°42' E), Jamnagar district, Gujarat. The bird was dead when picked up and had a ring on one leg. He removed the ring (Museum Stavanger Norway, 231503) and buried the bird. I learnt about this incident in the market place of Jamnagar, met Mr. A. N. Jadeja and contacted the Museum Stavanger. The Museum in-

formed me that the bird was an Osprey, *Pandion haliaetus* (Linné), ringed as a chick on July 13, 1985 at Hastfoss (69°07' N, 29°04' E), Norway. This would mean that the young bird had flown a distance of at least 5855 km. This is probably the first record of a European ringed Osprey recovered in India. The Osprey is a winter migrant to most of the Indian subcontinent, with a few possible nesting pairs in the Himalayas (Ali and Ripley 1982).

Types of wetlands

The Ramsar definition of “wetland”

- “Wetlands are areas of marsh, fen, peatland or water, whether natural or artificial, permanent or temporary, with water that is static or flowing, fresh, brackish or salt, including areas of marine water the depth of which at low tide does not exceed six metres” (Article 1.1).
- In addition, Ramsar sites “may incorporate riparian and coastal zones adjacent to the wetlands, and islands or bodies of marine water deeper than six metres at low tide lying within the wetlands” (Article 2.1).
- Importantly, the Convention aims at the listing of natural or semi-natural wetlands, but also allows for the designation of purpose-built, or human-made, wetlands, assuming they satisfy at least one of the Criteria.

Strategic Framework and guidelines for the future development of
the List of Wetlands of International Importance of the Convention
on Wetlands (Ramsar, Iran, 1971)

Map of Ramsar Sites (wetlands of international importance)

171 countries
2,495 Sites covering

East Asian-Australasian Flyway Partnership

PARTNERS OF EAAFP (39)

EAAFP Flyway Site Network

- Flyway Network Sites:
152 from 19 countries

- 1000+ Important sites
for migratory
waterbirds

- **Aim:** To make sure
the sites are
sustainably managed
to support the
survival of migratory
waterbirds

- Meeting criteria of
a Ramsar Site
- Designated by
Government

Overview of the Central Asian Flyway

- Only major largely land-locked flyway
- High variety of ecological conditions
- Many species breeding on the arctic coast
- High migratory waterbird biodiversity, >279 migratory waterbird populations of 182 species
- 29 globally threatened & near-threatened waterbird species (incl. Siberian Crane, White-headed Duck, Lesser Whitefronted Goose)

CAF Initiative under CMS – road from Gandhinagar to Samarand

International initiatives and partnerships

- African Eurasian Waterbird Agreement
- African Eurasian Raptors MOU
- African Eurasian Migratory Landbirds Action Plan
- CAF Waterbird Action Plan
- East Asian – Australasian Flyway Partnership
- Ramsar Convention on Wetlands
- World Heritage Convention

Western / Central Asian Site Network for the Siberian Crane and Other Migratory Waterbirds

National Planning for Conservation

- Integrating priorities for action with international cooperation
- Covering multi species and taxa
- Includes a range of habitats
- Habitat Management & restoration
- Species conservation Planning
- Multiple stakeholders
- National to local action
- Awareness raising
- Capacity building
- Research
- Monitoring
- Policy development
- Meeting national commitments to international development and conservation targets

Major habitats of the CAF (based on the first global map of IUCN habitats)

(Jung et al 2020 - available to view: <https://uploads.users.earthengine.app/view/habitat-types-map>)

Map of Important Bird Areas for migratory birds in the Central Asian Flyway

Source: Protected Planet (WDPA, October 2022) and BirdLife International.

Source: Mundkur et al. 2023. *Central Asian Flyway – Situation Analysis: The status of migratory birds and their habitats and recommendations for their conservation*. Report by BirdLife International, Cambridge.

Western / Central Asian Site Network for the Siberian Crane and Other Migratory Waterbirds

Goal of the Site Network

To ensure the long-term conservation of the Siberian Crane and other migratory waterbirds along the Western and Central Asian Flyways through recognition and appropriate management of a network of internationally important sites.

Principles of the Site Network

The initiative to establish a Siberian Crane site network under the CMS MoU will focus attention on:

- Sites of importance for the conservation or recovery of the Siberian Crane;
- Sites which are also important for other migratory cranes and waterbirds;
- Involving local people in conservation efforts at the sites.

Main recommendations of the CAF Situation Analysis

A. Development of a collaborative framework

Improve coordination & build synergies among international frameworks, both formal & informal & key stakeholders (incl. governments, international NGOs, scientists & others)

Source: Mundkur et al. 2023. Central Asian Flyway – Situation Analysis: The status of migratory birds and their habitats and recommendations for their conservation. Report by BirdLife International, Cambridge.

Main recommendations of the CAF Situation Analysis

B. Species management

- implementation of existing single species or multispecies action plans for globally threatened species & development of others
- listing of eight globally threatened & one near-threatened CAF species under the CMS Appendices.

Source: Mundkur et al. 2023. Central Asian Flyway – Situation Analysis: The status of migratory birds and their habitats and recommendations for their conservation. Report by BirdLife International, Cambridge.

Main recommendations of the CAF Situation Analysis 2/3

C. Taking & trade of migratory birds

- collisions from powerlines
- tackling illegal taking
- poisoning, diseases
- taking & trade of migratory birds - regulation of legal taking

Source: Mundkur et al. 2023. Central Asian Flyway – Situation Analysis: The status of migratory birds and their habitats and recommendations for their conservation. Report by BirdLife International, Cambridge.

Main recommendations of the CAF Situation Analysis

D. MANAGEMENT OF IMPORTANT SITES AND NETWORKS

- identification & management of sites of national or international importance to migratory bird species,
- establishment of a critical site network (>1700 sites)
- Facilitate and promote the designation of important sites for migratory birds under appropriate national and international conservation categories.
- Establish or review conservation site management plans incorporating prescriptions for migrant species.

Source: Mundkur et al. 2023. Central Asian Flyway – Situation Analysis: The status of migratory birds and their habitats and recommendations for their conservation. Report by BirdLife International, Cambridge.

Main recommendations of the CAF Situation Analysis

F. Research & monitoring

- monitoring of population trends, understanding causes of population change in migratory species, habitat use & management
- understanding migration patterns & connectivity along flyways
- building capacity
- improving exchange of information, collaboration & coordination between researchers

Source: Mundkur et al. 2023. Central Asian Flyway – Situation Analysis: The status of migratory birds and their habitats and recommendations for their conservation. Report by BirdLife International, Cambridge.

AWC National Reports

Monitoring waterbirds - International Waterbird Census

- A worldwide monitoring programme, covering all waterbird species
- Initiated in 1967, now the longest running global citizen science biodiversity monitoring programme
- Counts repeated annually in January/February and/or July

Objectives

1. Obtain information of waterbird populations at wetlands, for monitoring of populations and evaluation of sites
2. Monitor the status and condition of wetlands
3. Encourage greater interest and promote conservation

Wetlands
INTERNATIONAL

AWC India eBird Wetland Assessment Form

Asian Waterbird Census India eBird 2021 Wetland Assessment Form

INTRODUCTION

The Asian Waterbird Census (AWC) is an international programme that focuses on monitoring the status of waterbirds and wetlands. It also aims to increase public awareness on issues related to wetland and waterbird conservation. The census is carried out each January as a voluntary activity at national and local level. The AWC is co-ordinated by Wetlands International as part of global programme, the "International Waterbird Census".

The census has three major objectives:

1. Obtain information on an annual basis of waterbird populations at wetlands in the region during the non-breeding period of most species (January), as a basis for evaluation of sites and monitoring of populations.
2. Monitor on an annual basis the status and condition of wetlands.
3. Encourage greater interest in waterbirds and wetlands amongst people, and thereby promote the conservation of wetlands and waterbirds in the country and region.

Submission of your AWC count and wetland information can be provided in three ways:

1. eBird+AWC India Wetland Assessment Information (this form, see below)
2. AWC India Data Entry Form 2021 (Excel format)

The Excel Forms are available on request from awc@wetlands.org. These forms need to be submitted by email to a state coordinator (see <https://www.wetlands.org/profile/india/>) and cced to awc@wetlands.org. If there is no state coordinator, this information is sent direct to Wetlands International at awc@wetlands.org.

To use the eBird+AWC India Site Information, participants are provided with basic instructions on methods and guidelines for participating in the census and making the counts. You are requested to:

Do note that only eBird submissions accompanied by an AWC India-eBird Site Information will be accepted and included in the national and regional AWC overviews. So kindly complete the regular eBird count and this Site form for each site separately. Guidance for filling and submission of this form is provided below.

Kindly provide feedback on how we may improve this form in the last section in this form or by email to awc@wetlands.org.

GUIDANCE IN SUBMISSION OF THE AWC INDIA eBIRD FORM

The Wetland Assessment form requests the following information: basic information on the wetland, Visit Conditions, Wetland Characteristics, Main Uses, Threats to the Wetland and Threats to the waterbirds.

Please submit only one form per site covered. The AWC has a list of wetland sites that have been covered in previous years. We encourage you to check the list and to use the same site name as used before. This is important to enable long-term monitoring of sites and birds between years. The BNHS has a list of wetland Important Bird and Biodiversity Areas (IBAs). Both lists are available on <https://docs.google.com/spreadsheets/d/16EgY41A4CSpx7AYig27RIN2Em5fmuByNeLD8-zuzWmU/edit?usp=sharing>

For large-sized sites with well known and clearly demarcated sub-sites (or count unit area), it is necessary to submit a form for each sub-site. It is important to be able to identify the name of the sub-site clearly, for e.g. Chilika Lake–Mangalajodi; Chilika Lake–Nalabana, are two separate sub-sites within the Chilika Lake. It is possible that you will cover such sub-sites on different days or by different teams covering sub-sites simultaneously. The state coordinator/Wetlands International can review the counts and can combine accurately.

If there are multiple lists for a single site, ensure that there is no double counting across lists. In which case, please submit a separate form for each eBird list so that the state coordinator/Wetlands International can review the counts and can combine accurately.

Thank you for taking the time to fill in and submit your complete counts and site information. Your contribution to wetland and waterbird conservation is greatly appreciated

AWC Count & Site Data Entry File for India 2019											
Introduction											
1	The attached sheet "AWC Excel Count & Site Form Data Entry File" is an updated version of the offline data entry system for the Asian Waterbird Census (AWC) in India										
2	This AWC Form has been developed for use on Microsoft Excel 2010. To ensure that you are using a compatible version, in the Site Form check if the drop down menu on the Site Name gives you a list of names in alphabetic order and an information box appears. Otherwise, the version of Excel you are using is incompatible. AWC does not guarantee the format if the sheet is shared through Google Drive or Mac.										
3	The Forms to fill are aimed at enabling participants of the AWC to enter their count information in a standardised user friendly form.										
4	The Forms are also aimed at enabling state coordinators of the AWC to enter count information they receive from participants, who are unable to enter data in the Excel form.										
5	The Forms allows for rapid sharing of count information, data checking and collation, by coordinators.										
6	The use of this Form should allow for a more rapid production of state and national overviews that can be shared with participants and others on an annual basis.										
7	For species reporting, we utilise an autocomplete function that, while making data entry easier, can cause problems with different versions of Excel, blocked by different security systems due to the need to include formulas, filters, macros, etc.										
8	With your feedback, we aim to update this Form further if needed. So kindly do provide us your constructive comments and suggestions.										
Layout of Form											
1	"Read first" (yellow tab)- this page provides basic information and instructions for data entry and submission										
2	"Explanation" (yellow tab) - this page provides you explanatory notes on fields that need to be completed.										
3	"Site Form", "Visit Form" and "Counts Form" (green tabs) all need to be filled with information for a single site count/visit. The use of

Draft Country count totals by species for the period 2020 - 2024

The table below provides summaries of counts from the International Waterbird Census (IWC) between 2020-2024. The table shows count totals grouped by species and you can use the filters to display totals for specific countries or regions. As a default setting, waterbird counts from January are displayed. This is the main month for the IWC. However for various reasons many countries extend the IWC counts into December and February or carry out special counts in other months. To show all counts across the IWC season or from other seasons, please select these relevant months in the filter as well.

Data from the Neotropical Waterbird Census (CNAA) between 1990 and 2012 have been summarised in a separate excel sheet, which can be downloaded [here](#).

In order to support the monitoring of changes in the numbers of introduced species, this report also includes records of species that are not native to the country, i.e. vagrants, escapes or feral individuals of introduced species. National IWC coordinators are kindly requested to notify Wetlands International if any of these records are the result of erroneous data entry.

Please note that the numbers in this report are totals counted per country, which are always less than actual annual national totals and may still be incomplete. The numbers must not also be interpreted as representative of the waterbird trends in a country, as coverage may vary in different years or some data may not have been submitted to national coordinators for more recent years. The sole purpose of this report is to provide feedback to the IWC network and other stakeholders. Wetlands International does not permit quoting the data presented in the table below and takes no responsibility for its accuracy or completeness. For official national count totals or species estimates for scientific or policy purposes, please contact the relevant national coordinator(s).

This report follows the latest taxonomy produced by HBW and BirdLife International. Full details are available from the [Birdlife website](#). Subspecies information has been included where possible. Reporting of subspecies differs between countries, so these entries should be interpreted with some caution. For more information please contact us or the relevant National Coordinators.

We would like to extend our gratitude and sincere thanks to all national coordinators that have shared this valuable information and the many thousands of individuals around the world that have contributed to the collection of these counts.

Year Month

Latest Initiative for Central Asian Flyway

Resolution - UNEP/CMS/COP14.13

1. Decides to **establish an Initiative for the CAF (ICAF) as a platform for international cooperation under CMS**
2. Decides to **establish a Coordination Unit (based in India)**
3. Adopt a **Terms of Reference** for operation of ICAF
4. Implement ICAF through a **Programme of Work (POW)**
5. *Encourage* Parties, Range States, IGOs, NGOs and donors to contribute to ICAF objectives, and to **support the ICAF through with financial and technical resources**

Covers all migratory bird species – 600+

https://www.cms.int/sites/default/files/document/cms_cop14_res.14.13_initiative-for-central-asian-flyway_e.pdf

Remit of Initiative for Central Asian Flyway

The initiative will:

- a) develop and implement a Programme of Work (POW) that aligns with, and facilitates the development and implementation of, relevant resolutions, decision and plans adopted by the CMS, the CMS Family flyway instruments and other non-CMS frameworks relevant to conservation of migratory birds along the CAF;
- b) take measures that allow and secure ecological connectivity of populations;
- c) identify any relevant priority species or issues of importance in the CAF not covered by existing instruments and frameworks and make recommendations to the governing bodies of the Convention, the CMS Family flyway instruments and other participating non-CMS frameworks to make resolutions, decisions, or other agreements to fill these gaps;
- d) identify research gaps and priorities in the conservation of migratory birds for the CAF;
- e) promote innovative approaches that deliver sustainable benefits to the local communities as well as migratory birds and their habitats;
- f) develop and increase the capacity of Range States, stakeholders and local communities to conserve and manage, as well as monitor, populations of the migratory bird species and their habitats;
- g) assist in resource mobilization for priority actions including through cooperation with international financial institutions and public and/or private organizations;
- h) improve citizen science, education, and awareness on the need to conserve migratory birds and their habitats in the CAF; and
- i) enhance and facilitate communication and information sharing between the CAF Range States.
